

Sound

What is sound and how does it travel?

Key Vocabulary

sound
pitch
volume
vibrations
medium
sound wave
high
low
soft
loud
instrument
insulate
particles

VIBRATIONS

Sound is made when an object vibrates and therefore causes the air around it to vibrate too. These vibrations are carried to your ear for you to hear them.

Sound vibrations can travel through different materials:

SOLIDS:

metals, stone, wood

LIQUIDS: water

GASES: air

Sound travels better through some materials than others. It travels very well through metal pipes for example.

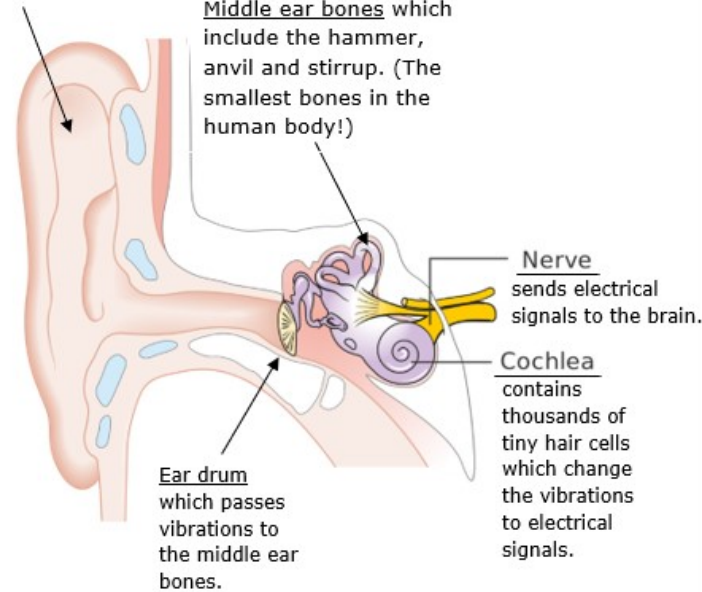

The louder the volume, the bigger the vibrations. The size of the vibration is called the **amplitude**. Quieter volumes have smaller amplitudes and louder sounds have larger amplitudes.

Sounds travel in a **wave**. The vibrations make **air particles** close to the object vibrate, which then passes the vibrations to the particle next to it and so on – like dominoes falling!

Outer Ear

DID YOU KNOW?

Sounds get fainter (quieter) as the distance from the sound

DID YOU KNOW? Sound-proofing is when a material is used to absorb loud sounds. Recording studios or night clubs might use them to stop sound escaping the room! Soft, spongy or pliable material is often best for this.

PITCH

The pitch of a sound is how high or how low it sounds. A high pitch has a high sound and a low pitch has a low sound.

Stringed Instruments

Tighter, thinner or shorter strings make higher pitches. Faster vibrations make pitches high and slower vibrations make pitches low.

Wind Instruments

The column of air inside the instrument causes it to vibrate. Shortening this makes a higher sound, lengthening it makes a lower sound.

Percussion Instruments

The surface is struck and it therefore vibrates. Smaller instruments have higher sounds (smaller keys of a xylophone, hand bells etc.). The tighter or thinner the skin on a drum, the higher the pitch.
